Shoreland Homeowner’s Guide to Lake Stewardship

Congratulations on owning shoreland property in Clearwater County. Whether you are a full time or seasonal resident, living by the water provides a special opportunity to participate in water-related recreation such as boating, swimming, or fishing; to observe wildlife in its natural habitat; or simply enjoy the beauty of watching a sunset over the lake and experience the serenity and sense of well-being experienced around the water and nature.

When you own shoreland you do have certain riparian (near the water) rights and privileges, such as the right to put a dock out to a navigable depth; to take water for domestic and agricultural purposes; and to fish, boat, hunt, and swim. But, these rights must be exercised in compliance with the rules and regulations of Clearwater County and the State of Minnesota. For example, there are limits on the size of docks; regulations about construction and disturbing land in the shoreland zone (within 1,000 feet of a lake or 300 feet of a river or stream); removal of aquatic plants; placement of wells; and maintenance of septic systems. These rules are in place for the benefit of your health and safety and the health of the adjacent lake or stream.

Along with those rights also comes the responsibility to protect, improve, and enhance the quality of the water for your enjoyment and that of future generations to come, keeping in mind that the water itself is a public resource for everyone to enjoy. That’s called stewardship: the individual responsibility to manage one’s life and property with regard for the rights of others. The lake is a living ecosystem and part of the larger ecosystem of all living plants and animals to which we also belong.

This guide will provide you with basic information on good lake stewardship. If practiced by you and collectively by others around the lake, good stewardship will protect your investment in your shoreland property (healthy waters = higher property values), promote your enjoyment of the lake, and also preserve the lake’s ecological integrity.

What We Do On the Land Matters

Water quality is primarily dependent on what happens on the land around the lake or along the river. It’s the runoff from the land and the pollution that is carried with it that can determine the quality of the water. While the land activity in the watershed (the land area that drains to a lake or stream) contributes pollution to the lake, the shoreland zone where you live is the lake’s first line of defense. What you and your neighbors do, or don’t do, on your shoreland property can have a significant impact on the quality of the lake. Managing water quality means appropriately managing the land use around the lake to reduce the amount of pollution that enters the lake.

In this Guide we’ll take a look at two primary ways you, the shoreland owner, can manage your property to protect water quality:

1. Curbing pollution at the source, and
2. Reducing, capturing, and cleansing runoff.

Proper lawn care, pet waste disposal, and use of household products; shoreline erosion control; and septic system maintenance can help curb pollution. Runoff that can pick up pollution and carry it to the lake can be reduced by minimizing hard surfaces on your property and limiting clearing and grading. It can also be captured and cleansed by using shoreland vegetative buffers and by redirecting it to rain barrels and rain gardens so it doesn’t reach the lake. Let’s learn more.
Curb Pollution: Reduce Phosphorus & Other Pollutants

Nitrogen, potash, and phosphorus are the nutrients necessary for plant growth. Phosphorus is the key nutrient needed for aquatic plant and algae growth. When excessive phosphorus reaches the lake, it fuels the overgrowth of aquatic plants and algae, those microscopic organisms that give water a greenish tinge and that can cause blue-green, toxic scum along the shore. Excessive plant and algae growth decreases water clarity, interferes with the recreational use of the lake, and diminishes oxygen for fish in the water, generally diminishing water quality.

Natural rainfall contains high amounts of phosphorus, which we can’t control, but we can control our own shoreland practices that contribute phosphorus to the lake. Excessive phosphorus can get into lakes from shoreland properties in a number of ways, including:

- Excessive application to and runoff from lawns.
- Decomposition of leaves and other plant material.
- Erosion of soil which has phosphorus particles attached to it.
- Improper human and pet waste management, both of which contain high amounts of phosphorus.
- Use of household products containing phosphorus.

Apply Fertilizer Sparingly and Use Zero-Phosphorus Lawn Fertilizer - It’s the Law in Minnesota!

Since 2005, by law Minnesota homeowners cannot use lawn fertilizers containing phosphorus, except for exemptions for new lawns or when a soil test indicates a need for phosphorus. In Clearwater County soils are naturally high in phosphorus so lawns generally don’t need any extra.

When shopping for fertilizer, buy a brand that has a middle number of zero, i.e. 22-0-20. The law does not prohibit retailers from selling phosphorus fertilizers. Even though most retailers are carrying more zero phosphorus fertilizers, it’s up to you to make sure you comply with the law.

If you have leftover phosphorus fertilizer, using it on the garden is a good way to dispose of it.

Other herbicide and pesticide cautions to follow:

- Eliminate the use of fertilizers near water or wetlands.
- Before fertilizing your lawn, aerate it and see if that improves its health.
- Use the minimum amount needed to replenish the soil and apply at the right time of year, usually spring and early fall. Water lightly after fertilizing to ensure absorption by the roots before a heavy rainfall.
- Sweep fertilizer that has spilled on hard surfaces back onto the lawn to prevent runoff.
Keep your lawn healthy to avoid the need for herbicide applications. When necessary, use the least toxic and most degradable herbicide and follow directions carefully. Never use near the lake.

Remove dandelions and other unwanted plants from your lawn using handtools instead of chemical applications. If you feel you must use herbicide for control, do not apply it to the entire lawn. Instead, use an applicator which allows you to direct a small spray toward each unwanted plant.

Keep Grass Clippings, Leaves, and Washed Up Aquatic Plant Material Out of the Lake

Grass clippings, leaves, and aquatic plant material that has washed up on shore all contain phosphorus, which is released when the plant material decomposes. To prevent phosphorus from getting into the lake:

- Use a mulching lawn mower and leave grass clippings on the lawn as natural fertilizer.
- Collect and compost leaves and clippings or haul them away from the lake to a disposal site.
- Rake up aquatic plants, leaves, and other organic matter on the shoreland and dispose away from the lake. Hint: It makes great mulch on the garden, which can later be worked in as a soil amendment.
- Do not burn leaves near the lake. Fire destroys organic matter and releases the phosphorus which can then be washed into the lake.

Locate Fire Pits Away from the Shoreland and Dispose of Ash

The leftover ash from burning wood is very high in phosphorus. If the fire pit is located near the lake, rain can wash the ashes into it.

- Locate the fire pit at least 50 feet away from the lake.
- Remove ashes to prevent them from washing or blowing into the lake.

Properly Dispose of Pet Wastes

Improper disposal of pet wastes not only jeopardizes water quality, but your health as well. Pet waste contains phosphorus and may contain disease causing organisms. If washed into the water, these organisms can make the area unsafe for swimming.

- Pick up pet waste in the yard or near the shore and dispose of it properly.

Use Phosphorus-free Household Products

Read labels carefully and select bio-degradable, non-phosphorus dishwashing detergents and reduce the use of chemical cleaners. Learn about and use natural, non-toxic household alternatives.

Practice Low-Impact Boating

To reduce the pollution impact of motorized watercraft on the lake:

- When fueling the boat, take precautions not to overfill the fuel tank. If you do spill, wipe it up with a rag, do not hose it into the water.
- Boat slowly. Motors stir up sediment-releasing pollution that can lead to deterioration of water quality (a 50-horsepower motor operated at full throttle can stir the water column to a depth of 15 feet).
- Keep your motor well tuned; use four-cycle motors.
- Inspect your boat and trailer to avoid transporting aquatic invasive species, like Eurasian watermilfoil, curly-leaf pondweed, or zebra mussels into the lake.
Protect Our Lakes: Stop the Spread of Aquatic Invasive Species (AIS)

Aquatic Invasive Species (AIS) are plants and animals released either accidentally or intentionally into areas where they are not native. Such introductions usually occur through human activities and often are spread through boating activities. The introduction of AIS often has irreversible economic, recreational, and environmental impacts.

Imminent AIS Threats to Clearwater County

There are several plant and animal species that have been designated by the Minnesota DNR as regulated invasive species making them illegal to release into the wild. Although many of these species have not yet been identified in Clearwater County, several have been found in bordering counties. The establishment of these species in a body of water will have lasting impacts that affect natural environments, recreational activities, and lakeshore property values.

Eurasian Watermilfoil

In nutrient-rich lakes it can form thick underwater stands of tangled stems and vast mats of vegetation at the water's surface. In shallow areas the plant can interfere with water recreation such as boating, fishing, and swimming. The plant's floating canopy can also crowd out important native water plants. A key factor in the plant's success is its ability to reproduce through stem fragmentation and runners. A single segment of stem and leaves can take root and form a new colony. Fragments clinging to boats and trailers can spread the plant from lake to lake. The mechanical clearing of aquatic plants for beaches, docks, and landings creates thousands of new stem fragments. Removing native vegetation creates perfect habitat for invading Eurasian watermilfoil.

Curly-leaf Pondweed

Curly-leaf pondweed grows from shore to depths of up to 15 feet. The leaves are somewhat stiff and crinkled with serrations on leaf edges, approximately ½ inch wide and 2 to 3 inches long. Curly-leaf's ability to grow in cold water, even under the ice, gives this invasive aquatic plant a head start in growth. It effectively crowds out native vegetation. When it completes its growth cycle in early summer, it can create mats of dying vegetation. Phosphorus released from these decomposing mats can result in algae blooms and severely impaired recreational use.
Purple Loosestrife
It was introduced into the east coast of North America in the 1800s. First spreading along roads, canals, and drainage ditches, then later distributed as an ornamental, this exotic plant is in 40 states and all Canadian border provinces.

Purple loosestrife invades marshes and lakeshores, replacing cattails and other wetland plants. The plant can form dense, impenetrable stands which are unsuitable as cover, food, or nesting sites for a wide range of native wetland animals including ducks, geese, rails, bitterns, muskrats, frogs, toads, and turtles. Many rare and endangered wetland plants and animals are also at risk due to the impacts of purple loosestrife.

Zebra & Quagga Mussels
Zebra mussels and a related species, the Quagga mussel, are small, fingernail-sized animals that attach to solid surfaces in water. Adults are 1/4 to 1 1/2 inches long and have D-shaped shells with alternating yellow and brownish colored stripes. These freshwater mussels can attach to just about any object in the water. They cause problems for lakeshore residents by clogging water intakes on watercraft and irrigation systems, covering recreational water equipment, and harming individuals swimming in infested waters.

Do Your Part
You play a key role in protecting your lake from infestation by aquatic invasive species. Following all regulations regarding the transportation and release of aquatic plants and animals is the best way to ensure you do not spread AIS to your lake. Current rules and regulations regarding AIS can be found on the Minnesota DNR website. Always be observant of the plants and animals that you find along your shore. Being familiar with your shore can help you identify the presence of new species of aquatic plants or animals that may be invasive.

A healthy native plant community is a great defense against the establishment of AIS. Protecting the native vegetation on your shoreline and in the water discourages invasive species. Native plant communities will also benefit native wildlife.

Removing docks and other water-related equipment in the fall provides an opportunity to inspect for signs of AIS, especially Zebra and Quagga mussels. Look on the posts, wheels, and underwater support bars of docks and lifts, as well as any parts of boats, pontoons, and rafts that may have been submerged in water for any extended period. In newly infested waters, adult zebra mussels may not be abundant, so there may only be a few mussels on a piece of equipment.

People who find something they suspect is an aquatic invasive species should take a picture of it, keep a specimen, and report it to the nearest DNR invasive species specialist. A listing of specialists is available on the DNR’s website.
Curb Pollution: Inspect and Maintain Your Septic System

Most homes in shoreland areas rely on Subsurface Sewage Treatment Systems (SSTS), commonly known as septic systems. Your septic system, if designed, installed, and maintained properly, will effectively treat wastewater before it is returned to the environment. This protects public health and prevents pollution of nearby lakes or rivers.

Understand How Your Septic System Works

Understanding your system is essential to proper operation and maintenance. The basic components of most systems are the:

- **Septic tank** receives the wastewater from the household plumbing. In the tank, the solids are separated from the liquid. Here, naturally occurring bacteria decomposes food particles and human waste and the remaining solids settle to the bottom until they are pumped out on a regular basis. The tank will have an inspection pipe for monitoring of the tank and a manhole for access when pumped. The size of the tank is based on the home’s potential water use and types of appliances installed. When the capacity of the tank is reached the excess liquid flows or is pumped out into the drainfield.

- **Soil treatment system (drainfield)**, which is typically a network of perforated pipes surrounded by small rocks and soil. The liquid, which contains pathogens (disease causing organisms), nutrients such as phosphorus, and fine solids, is cleansed naturally by bacteria as it percolates down through the soil. The design of the treatment system (trench, mound, etc.) is based on the soil conditions on your property, which must allow for at least three feet of unsaturated soil for the wastewater to percolate through for proper treatment. The correct type of system needed for your property will be determined by a state licensed septic designer. Where gravity flow is not enough to move the liquids from the tank to the soil treatment system, pumps or lift stations are common—this is typical with mound systems.

What Causes a Septic System to Fail?

Septic system failure is most commonly the result of:

- Improper design or installation of the system.
- Overuse of water in the home.
- Improper maintenance.

When your system or a neighbor’s system fails untreated wastewater could come in contact with people, causing a public health hazard. It could also enter the groundwater and eventually the lake, adding pollution that contributes to increased algae and aquatic plant growth and declining water quality.

What are the signs of a failing system?

- Sewage backup into the house or slow toilet flushing.
- Frozen pipes or soil treatment areas.
- System alarms sounding.
- Wet and/or black areas around a septic mound.
- Algal blooms and excessive plant growth in the water near shore.
- Sewage odors indoors or outdoors.
- Water or sewage surfacing in the yard or a nearby low spot.
- High levels of nitrates or coliform bacteria in well water tests.

Properly Operate and Maintain Your System

Proper operation and maintenance will extend the life of your system for many years and prevent costly repairs.

- **Pump the Tank Regularly**
  Have a licensed professional pump the solids (floating scum and sludge) that have accumulated from the septic tank every one to three years—the more use, the more often pumping is needed. While garbage disposal use is not recommended with septic systems, pump annually if you are using one. Failure to remove the solids can cause them to enter the drainfield, which can result in expensive repair or replacement. For licensed and certified septic system maintenance services, refer to the yellow pages under septic tanks and systems-cleaning or contact Clearwater County Environmental Services.

If you have a problem:

- Contact Environmental Services and/or a licensed septic professional for advice.
- If the drainfield or household pipes are clogged, have the system pumped as a temporary measure.
- If there is surfacing of wastewater, fence off the area to prevent contact with humans or pets.
✓ **Practice Water Conservation**
Too much water flowing into the tank will cause the tank to back up and lead to ineffective treatment of wastewater. To prevent this:
- Repair all leaky faucets, fixtures, and appliances.
- Install low water-use fixtures and appliances (especially toilets and shower heads).
- Do not empty roof drains and sump pump water into the septic system.
- Wash only full loads of clothing and dishes, and spread out water use, such as laundry, throughout the day and week. Consider front loading washing machines that use less water.
- Reduce the length of showers and the number of toilet flushes, especially during high use periods.
- Reroute water softener discharge water out of the septic system.
- Do not hook floor drains or drain tile into the septic system.

✓ **Limit What Goes Down the Drain**
- Do not put household cleaners, paint, solvents, medications, or other chemicals down the drain.
- Limit the use of antibacterial products. As the name suggests, they can reduce the amount of working bacteria in the septic tank.
- Use only the recommended amounts of liquid non-phosphorus detergents and cleaners.
- Prevent food particles, grease, lint, coffee grounds, plastics, and other non-degradable solids from getting into the system.
- Use single-ply toilet paper for the best decomposition.

✓ **Do Not Use System Additives**
It is not necessary to use starters, feeders, cleaners, or other septic additives to enhance the performance of your system. If your system is properly maintained and operated, it will operate at maximum performance with only naturally occurring bacteria.

✓ **Protect Your Drainfield**
Compacting or obstructing the soil over the treatment area can cause malfunctioning of the drain field. To protect it:
- Keep heavy vehicles off the drainfield.
- Maintain vegetative cover, but do not plant trees or shrubs on the drainfield because the roots may penetrate and clog the distribution system.
- Mow the area, but do not fertilize or water.
- Reroute roof drains and drain tile away from the drainfield.

**Protect Your System from Freezing**
Common causes of septic system freezing during the winter can be lack of snow cover, extreme cold, compacted snow, irregular use of the system, leaking plumbing fixtures, pipes not draining properly, or a water-logged system.

**What to do if the system freezes?** Unplug your pump and call a septic system professional. Do not add antifreeze, additives, or continuously run water to try to thaw the system.

To prevent freezing follow these general guidelines:
- Fix leaking plumbing or appliances prior to winter.
- In the fall, leave the grass longer over the tank and drainfield for better insulation.
- Add a layer of hay or straw mulch (8-12 inches) over the pipes, tank, and soil treatment area.
- Keep ATVs and snowmobiles off the drainfield.
- Spread hot water use (laundry, showers, dishwasher) out over the day and week. If you’ll be gone for extended periods, consider having someone stop by to run hot water regularly.
- High efficiency furnaces, water softeners, and iron filters have the potential to cause problems in the winter because of slow and/or periodic discharges of water.
- Talk with a professional before installing heat tapes or tank heaters.

**Clearwater County Requirements**

**Who regulates?** The design, inspection, and installation of septic systems are regulated by Clearwater County and must be done by professionals licensed by the state. Lists of licensed professionals and permits for septic system installation can be obtained from the Environmental Services office.

**What records are required?** All septic systems must have a Certificate of Compliance indicating they meet the Clearwater County Sewage and Wastewater Treatment Ordinance. A Certificate is good for five years from the date of original installation and must be renewed every three years thereafter.

**When are inspections required?** If you are applying for a building permit for new construction, a compliant septic system is required. A building permit for any addition to current buildings, including a deck or garage—attached or non-attached, requires a current Certificate of Compliance for the septic system. If one is not on record or it is not current, an inspection of the septic system will be required. If the system is found to be noncompliant, modification or replacement of the system may be necessary before a building permit is issued.
Reduce Runoff

What is runoff?
Snowmelt or rainwater that does not soak into the ground and instead runs off hard surfaces such as roofs, driveways, sidewalks, and compacted soils or washes off lawns and steep slopes is called runoff. It is also referred to as stormwater. When runoff reaches the lake, it can carry with it chemicals, eroded soil, toxic materials, bacteria, and other pollutants that can be detrimental to water quality, fish health, and wildlife habitat. Reducing runoff decreases the pollutants that eventually reach the lake.

Managing stormwater on your property so it soaks into the ground (infiltrates), rather than running off, is the best way to filter out pollutants before they reach the lake. Hard or paved-over surfaces do not allow the absorption of water. Any green space, including gardens, trees, shrubs, or landscaping, allows water to permeate slowly down into the soil and roots.

Practice Good Lawn Management

Reduce the Amount of Lawn
Bringing the suburban lawn mentality to the lake has brought more opportunities to degrade the quality of our lakes. Limit the amount of lawn and keep as much natural vegetation as possible. Replant natural vegetation—especially near the lake. Not only will you reduce runoff, you’ll reduce the amount of yard work, freeing you up to recreate instead.

Maintain a Healthy Lawn to Absorb More Water
- Mow to a height of two to three inches; mow when dry to prevent clumping. Taller grass provides shade for better root growth, which helps with water absorption.
- Consider replacing some of the grass in your lawn area with clover, native grasses, or other groundcovers that don’t need watering.
- If watering is necessary, water deeply, but infrequently, to encourage deep root growth. Water with lake water. (Hint: use the nutrients in the lake to make a healthy lawn instead of frequent fertilizer applications.) Water in the morning, not mid-day or evening.
- In hot weather, allow lawn grasses to go into a state of dormancy so that they require less water and nutrient intake for survival. Water 1/4 to 1/2 inch every two or three weeks to keep crowns from dehydrating beyond the point of recovery.
Maintain Natural Vegetation

Natural vegetation will naturally reduce runoff by holding back the water to provide time for it to soak into the ground.

- When clearing your lot, minimize the removal of wooded areas, trees, and low growing shrubs. Their removal causes more rain to fall to the ground instead of landing on leaves and branches. In addition, those shrubs are most likely the next generation of tree growth.
- Grading large areas of land removes the natural depressions of land where water can pond and soak in.
- Carefully landscape your yard near roads, driveways, and along the shoreline to direct runoff away from the lake.

Reduce Hard Surfaces, Like Roofs and Driveways

Since hard surfaces cannot absorb water, reducing the amount of hard surfaces on your lot will reduce the volume of runoff.

- When considering additions, decide if the extra space is really necessary. Could you build up instead of out to reduce the roof size?
- Minimize the amount of paved surfaces, such as driveways and sidewalks. Locate driveways, sidewalks, stairways, and footpaths away from steep slopes.
- If you’re installing a new patio or rebuilding a walkway, use bricks, interlocking pavers, or flat stones set in sand instead of concrete. For driveways, consider using pervious pavers or pervious asphalt, both of which allow water to run through.
- When compacted, well-worn paths act like asphalt. Cover them with mulch to absorb water.

Clearwater County limits the amount of hard (impervious) surfaces on shoreland parcels; contact Environmental Services for more information.
Alterations necessary for the construction of structures or facilities must be designed and conducted in a manner that ensures that only the smallest amount of bare ground is exposed for the shortest time possible.

Reduce Runoff: Curb Erosion

Any exposed soil can be washed away with stormwater. When soil washes into the lake, it carries with it phosphorus (a chemical that promotes weed and algae growth), debris, and other toxic materials that may be on the land. Runoff causes sediment build up in the lake; increases murkiness after rain events, which interferes with normal lake functions; and impacts fish and wildlife habitat. Degradation to water quality is a result. Curbing the erosion of soil reduces pollutants entering the lake.

Monitor Construction or Renovation Projects

Have an erosion control plan and carefully monitor all construction or renovation projects to ensure that soil and construction materials do not runoff the exposed soils.

- Properly dispose of all construction materials each day.
- Use nontoxic, biodegradable, or recycled materials.
- Wash or clean any liquid materials indoors or directly into a container.
- Install silt fences along the shoreline to capture any sediment runoff that might occur.
- After construction, establish vegetation right away.
- Minimize land alteration around your construction projects to take advantage of existing soil stability.

Stabilize the Soil in Steep Areas

To reduce the erosion potential on steep slopes and bluffs:

- Divert water away from steep slopes by rerouting drainpipes and gutters. If diverting water away from the bluff is impractical, it should be routed through a non-perforated plastic drain pipe that outlets at the very bottom of the bluff into rock drainage.
- If you need a walkway to the shore, follow the natural contours of the slope to go across or around the slope. Use steps when a walkway must go directly up and down a slope, but minimize destruction of natural vegetation during construction.
- Keep the moisture- and nutrient-absorbing natural vegetation on steep slopes by limiting clearing and grading.
- Replant vegetation on barren slopes.
- Create a view corridor through the trees with selective pruning to enjoy an excellent view while maintaining the protection of natural trees and shrubs.
Reduce Shoreland Erosion

If your shoreland is eroding away, stabilizing it is necessary to reduce soil loss. Possible causes may include:
- Fluctuating water levels.
- Increased wave or wake action.
- Ice pushes in the spring.
- Loss of natural vegetation to hold the soil in place.

Each shoreland situation is different and consulting shoreland landscaping professionals, the DNR area hydrologist, or the Clearwater Soil and Water Conservation District is encouraged to determine the best solution for your shoreline erosion problem.

Rip rap rocks and retaining walls are usually not the best choice for stabilization. They are expensive and can negatively impact the lake by creating an unnatural barrier between upland areas and the shoreline environment. Rip rap should only be used if deemed necessary after consultation, and never to replace a stable, naturally vegetated shoreline. If rip rap is used, it is most effectively used in combination with natural vegetation to stabilize the soil between the rock material.

Naturalizing your shoreline or maintaining the natural shoreland vegetation is the most important and effective way to reduce shoreland erosion. In addition to enhancing water quality, natural shorelines help maintain good fishery resources and provide wildlife habitat (see pages 10 & 11).

Slow the Boat Down

Boat wake can cause tremendous shoreland erosion, so boat slower. In shallow areas (less than 15 feet) motor at slow, no-wake speeds (5 mph or less). Slower boating reduces the boat wake and the consequent wave action that can erode your shoreline and others’ around the lake. Observe all posted “no-wake” and low-speed zones. For personal watercraft, running at slow, no-wake speed within 150 feet of the shore is the law.

Boating slowly makes less wake, less noise, reduces pollution, and is less disruptive to wildlife and other people. Plus you’ll see more and enjoy the lake longer. When running at higher speeds, keep the motor properly trimmed to reduce noise and boat wake.

On steep bluffs, selective pruning of trees and shrubs to create a view corridor of the lake, while keeping the vegetative undergrowth, will stabilize the soil.
Reduce Runoff: Maintain a Natural Shoreline

Preserving or restoring a native shoreline is the best way to reduce shoreland erosion, protect water quality, and improve the health and diversity of shoreland and upland birds, wildlife, and aquatic plants.

Native vegetation acts as a buffer zone between the shoreland and the water. This buffer intercepts nutrients and reduces runoff, erosion, and sedimentation.

If your shoreland is already natural, congratulations and please keep it that way. If you have lawn to the water’s edge or very little native vegetation near the shore, consider a natural landscaping—“lakescaping”—project to restore your shore by creating a shoreland buffer.

Creating and maintaining a natural buffer zone along your shore does not mean your property has to look messy, but it may mean you have to rethink what lake shoreland should really look like. Even if your neighbors are not restoring their shoreland, it is important for you to proceed. Restoring a natural buffer improves your property, protects water quality, and sets a good example for others to follow. Many individual choices have a cumulative impact on the lake and its ecosystem. Ultimately, keeping the water clean can be far less costly than cleaning up a damaged lake. Furthermore, clean waters framed by natural vegetation often have the highest property values.

What is a Buffer Zone?

A buffer zone consists of:

- The shallow aquatic zone of the emergent, submerged, and floating leaf aquatic plants that provide food and shelter for ducks, songbirds, fish, and reduce problems caused by Canada geese. The taller plants like bulrush, sedges, and cattails can reduce the energy of wave and wake action. They minimize erosion and help maintain water quality.
- The upland zone includes native trees, shrubs, grasses, and wildflowers that hold the soil on the bank in place. This vegetation slows rainwater runoff, absorbs water and nutrients, and breaks down pollutants.

A mostly natural landscape has only 10% runoff.

A natural shoreline with well developed buffer zones can provide as much as 500% more diversity of plant and animal species as compared to upland areas.

In contrast, an unnatural shoreline reduces habitat and wildlife diversity, leads to more erosion, increases water pollution, and negatively affects property values.
Current recommendations suggest a minimum 35 foot shoreland buffer of native plants landward from the shore. However, even adding a buffer as narrow as 10-15 feet from the water’s edge will help reduce runoff. When it comes to shoreline buffers, wider is better for more benefits.

Getting Started Creating a Shoreland Buffer

- **Don’t mow.** A simple, no-cost way to start restoring your shoreland is to stop mowing for the width of the desired buffer strip. Seeds in the soil will germinate and valuable native plants will begin to appear. You can note the types of native plants and wildflowers growing on natural shorelines around the lake to get an idea of what is likely to appear or be suitable for growing in your area. You may later need to weed out nuisance species or add native plants for diversity, but it will get you started.

- **To be more thoughtful about a restoration project, assess the shoreline and your needs.** Do you have erosion problems to correct? Problems with geese? What kind of wildlife would you like to attract? How much area is needed for lake access for boats and swimming? Limiting the beach and dock area to 15-20 feet and leaving the rest of the shoreland natural is ideal to have both the benefits of the buffer zone while having recreational access to the lake.

- **Consult resources and natural landscaping professionals.** Before proceeding with an extensive planting project, you’ll likely need to consult with professionals for help with designing your project to ensure your goals are met. Consult with natural landscaping specialists at local nurseries, take a class in shoreland restoration offered through the University of Minnesota Extension Service, talk with Extension educators, or contact the Clearwater Soil and Water Conservation District for resources and fact sheets on designing your project, selecting plants, preparing the site, and planting.

The book *Landscaping for Wildlife and Water Quality* and the *Restore Your Shore* multimedia website are two highly recommended resources to get you started. These are both available through the Minnesota DNR (http://www.dnr.state.mn.us/eco/pubs_restoration.html).

**Protect Aquatic Habitats**

The aquatic zone is a vital part of the shoreland buffer system. Aquatic vegetation helps purify the lake by removing contaminants and calming the water, which allows suspended soil particles to settle to the bottom of the lake. If submerged aquatic plants are interfering with swimming, clear by hand only what is needed to provide a small swimming area. Leave other submerged plants in place. Chemical treatment or any destruction of cattails, bulrushes, or wild rice requires a permit from the DNR Area Fisheries office.

**Leave Fallen Trees and Branches in the Water**

Unless they are interfering with your recreational access, leave trees and branches that have fallen into the water where they are. They form critical habitat for aquatic organisms that fish and other aquatic life consume, and serve as a dock for turtles, kingfishers, and other interesting wildlife. The fish and wildlife will appreciate it.
Capture and Cleanse Runoff

When It Rains, It Pollutes

Rain typically carries some pollutants, including phosphorus and mercury. You cannot do much about this source of the pollution, but you can capture some rainwater and allow it to be cleansed through natural soil processes to prevent it from running off into the lake where it can be detrimental to water quality.

The best way to do this is to divert rainwater off roofs, driveways, and other hard surfaces into rain barrels or the lawn, or create a special “rain garden” designed to capture and clean the rainwater naturally.

Divert Rainwater Off Roofs and Driveways

Building roofs and driveways comprise most of the impervious (impermeable) surfaces on a shoreland lot. Redirect rainfall flows from drain spouts, roof gutters, and driveways onto vegetated areas and away from the lake, steep slopes, and bluffs. In this way it can be captured, given time to infiltrate naturally into the soil, or be used for watering, instead of pouring directly into the lake.

Install a Rain Barrel

A rain barrel is any type of container used to catch water flowing from a downspout and store it for later use.

The rain barrel is placed underneath a shortened downspout diverting the roof runoff into the barrel. The rain barrel has a spigot to collect the stored water for use in watering flower gardens, house plants, and lawns.

Due to lack of research at this time, water collected in a rain barrel is not recommended for watering vegetable gardens. Humans and pets should not drink the stored water. Non-toxic mosquito dunks are available at garden supply stores and mail order catalogs to prevent them from breeding in the stored water.

Rain barrels need to be cleaned routinely during spring and summer months to reduce algae growth. During winter months, take your barrel out of operation by simply turning it upside down at the same location or storing elsewhere.

Rain barrels can be purchased at garden centers, ordered online from garden catalogs, or you can make your own (see resources on back page).

How much rain do I need to fill a 50-gallon barrel?

For every inch of rain that falls on one square foot, you can collect just over half a gallon of rainwater (0.6 gallons).

For example, if you have a shed that is 10’ x 10’ and you collect roof runoff from all 100 square feet of your roof, you can collect 60 gallons of rainwater during a 1-inch rain event.

Garden with water quality in mind!
A rain garden is just what it sounds like—a garden to soak up rain water. It is a recessed planting bed, shaped like a saucer or shallow bowl, designed to collect runoff from driveways, roofs, and other hard surfaces or sheet flows of rainwater from lawns. The collected water is then infiltrated into the ground instead of running off into the lake.

Rain gardens are planted with hardy, water-loving native perennial plants. The deep roots of these plants work along with the soil to filter and catch pollutants such as phosphorus, oil, mercury, and other heavy metals in rainwater that runs into the garden area. Rain gardens allow sediments that are carried with runoff to settle and plants to absorb the nutrients. During a rainfall, the highest concentration of pollutants is during the first inch, or first flush of a storm, which is retained in the rain garden.

A typical rain garden should be located at least 10 feet from the house and will range from 100 to 300 square feet in size with a depth of 4 inches to 10 inches. As a rule of thumb, one garden will handle the runoff from a hard surface that is about three times its size. For larger surfaces, more than one rain garden may be needed to handle the runoff, perhaps one rain garden near each downspout. Rain collected will recede into the ground within several days, sometimes even hours depending on your type of soil.

To be effective, the shape and size of a rain garden must be properly designed. The garden must accommodate the amount of roof, driveway, and other hard surfaces on the property as well as the soil conditions. Plants must be used that are appropriate for your soil type and will also tolerate standing water for up to 48 hours.

For proper design, it is recommended to consult resources to help you determine the proper plants and dimensions. Talk with the Clearwater County SWCD or a landscaping professional who is knowledgeable about rain gardens. See the “How-To” resource on the back cover or do an internet search for much more information.

Rain Garden Tips:
- Don’t worry about mosquitoes. Most rain gardens will not hold water long enough for them to reproduce.
- When first planted, hand weed biweekly until native plants are established.
- Don’t fertilize near the rain garden, it will stimulate weed competition without benefiting the native plants.
- During heavy rains, your rain garden may fill up and overflow. Make sure the overflow drainage follows the drainage designed for your lot.

What Can I Do On My Shoreland Property? What Permits Are Required?

Who Has Regulatory Authority in the Shoreland Zone?

The shoreland zone is defined as the land within 1,000 feet of a lake and 300 feet of a stream or river.

- For any actions in the water or on the land below the ordinary high water level (OHWL) of a public water (lakes, rivers, streams, wetlands), check with the appropriate Minnesota Department of Natural Resources (DNR) office for permits that may be required.

- For any actions on the land above the OHWL (the upland areas of your property) and within the shoreland zone, contact Clearwater County Environmental Services. If located within the boundaries of a city, contact the appropriate city office. (Lomond Lake—Bagley)

How do I know where the ordinary high water level is? For lakes and wetlands, the OHWL is the highest water level that has been maintained for a sufficient period of time to leave evidence on the landscape. It is commonly that point where the natural vegetation changes from predominantly aquatic to predominantly terrestrial.

The OHWL is a reference elevation that defines the DNR’s regulatory authority, and it is used by Clearwater County to determine their regulatory zone and appropriate setbacks for buildings.

If there is a question about the OHWL on your property, contact the DNR Area Hydrologist in Bemidji, Environmental Services, or the Clearwater Soil and Water Conservation District.

Commonly Asked Questions about Shoreland Activities:

What are the requirements for installing a retaining wall or rip rap for erosion control? A DNR public waters work permit is required to build a retaining wall along your shoreline if the structure is proposed below the OHWL. Retaining walls are discouraged, particularly on relatively undeveloped lakes. Planting vegetation for erosion control is preferred; rip rap may be allowed without a DNR permit if specific conditions are followed during installation. For either a retaining wall or rip rap installation, you will need technical advice for the best success. Contact both the DNR Hydrologist and the Clearwater SWCD for assistance. Also, refer to the DNR Shoreland Alteration fact sheet.
Do I need a permit for a sand blanket or beach development? Everyone wants a nice sandy beach area, but trying to create a sandy beach where it has not existed naturally may not always be successful. Before making your decision, be aware that wave action can erode the beach and sand will migrate down shore, possibly damaging fish and wildlife habitat. If the lake bottom is soft, the sand will only sink into the muck and disappear. Sand blankets cannot be applied over bulrush and cattails. Also, other vegetation will continually emerge.

Before installing a sand blanket, contact the Area DNR Waters office for installation and possible permit requirements. Refer to the DNR Shoreland Alteration fact sheet for specifications.

What rules apply to docks? Docks are privately owned structures which are allowed to be placed in public waters of the state to provide access to the use of the water. Dock rules are established by the DNR to prevent the deterioration of the lake's ecosystem from excessive or inappropriate dock placement.

In choosing the right dock configuration for your property, it is important to keep in mind that a dock is private property placed on a public resource, which can have detrimental impacts on the lake. Docks may shade out important aquatic plants and cause fragmentation and destruction of valuable emergent and submerged aquatic vegetation. These plants provide habitat where fish spawn, feed, grow, and find shelter from predators.

Keep dockage appropriately balanced between reasonable access and resource protection. Minimize the use of docks for activities that are better intended for land, such as barbecues and screened structures.

In shoreland areas where there are large bulrush and other emergent aquatic vegetation beds, consider consolidating docking with your neighbors to minimize the destruction of the lake.

A DNR individual permit is not required for a dock if it meets current dock rules under DNR General Permit No. 2008-0401. This information can be found on the Minnesota DNR website or obtained from any regional DNR Waters office.

Can I control aquatic plants in front of my shoreline? The removal or destruction of aquatic plants is a regulated activity under the DNR’s Aquatic Plant Management Program. Aquatic plants are a valuable part of the lake system. They stabilize bottom sediments, protect water clarity, prevent shoreline erosion, and are important fish habitat.

You are encouraged to keep destruction of aquatic plants to a minimum. Unless aquatic plants are interfering with lake access, swimming, or other water recreation activities they should be left alone. If you are seeing unusually high plant growth where it has not previously occurred, look for possible causes. New sources of phosphorus getting into the lake from your property might be fueling the growth, such as excessive runoff, a malfunctioning septic system, or shoreland erosion.

If management is desired, consider managing plants only in the swimming area. It is not necessary to have the entire shoreline devoid of submerged aquatic plants. For management, you need to know:

- No emergent plants can be destroyed (bulrushes, cattails, wild rice) without a DNR permit.
- Submerged vegetation can be manually controlled (hand cutting or pulling) in an area not exceeding 2,500 ft² or wider than 50 feet along the shore or half the width of your property, whichever is smaller. More than that requires a permit.
- Cut or pulled vegetation must be removed from the water and the cleared area must remain in the same place from year to year.
- A permit from DNR Fisheries is needed to:
  - Use any chemicals or automated mechanical devices (such as the Crary WeedRoller, Beachgroomer, or Lake Sweeper).
  - Use copper sulfate for swimmers itch control.
  - Remove floating leaf vegetation in an area larger than a channel 15 feet wide to open water.
  - Remove or relocate a bog of any size that is free floating or lodged anywhere.
  - Plant aquatic plants below the OHWL as part of a shoreline restoration project. This activity is encouraged and there is no permit charge!

These activities are not allowed in any circumstances:

- Excavating the lake bottom for aquatic plant control, using lake-bottom barriers to destroy or prevent the growth of aquatic plants.
- Removing vegetation from posted fish spawning areas.
- Removing aquatic plants from an undeveloped shoreline.
- Removing aquatic plants where they do not interfere with swimming, boating, or other recreation.

If you see violations of these or any other permit requirements, contact your Conservation Officer immediately. Photo documentation is appreciated.
Clearwater County Permit Requirements

Building Permits for New Construction, Remodeling, or Adding on Decks, Garages, etc:
Contact Clearwater County Environmental Services
Any new building or structure will need a permit. On-site inspection may be required in some cases prior to issuing a permit. Obtain the permit before starting any construction.

Variance for Building Permits:
Contact Clearwater County Environmental Services
For projects that do not conform to Clearwater County regulations, a variance to the ordinance will be needed from the Board of Adjustment, and may require mitigation actions such as planting or retaining vegetative buffers, diverting runoff from structures, etc. Keep in mind that considerations for a variance depend on many factors and it is likely that variances without merit will not be approved.

Accessory structures e.g. boathouses, fish houses, gazebos, etc.:
Contact Clearwater County Environmental Services
Water oriented accessory structures including, but not limited to, boathouses, gazebos, screen houses, fish houses, pump houses, and detached decks are prohibited.

Dirt Moving in the Shoreland Zone (such as ice ridges, shoreland landscaping, etc.):
Contact Clearwater County Environmental Services and Clearwater SWCD
Any dirt moving within the shoreland zone requires a permit from Environmental Services.

Wetland Draining, Filling, or Excavation in the Shoreland Zone:
Contact Clearwater County Environmental Services
Limited wetland impacts may be allowed in some cases. However, if the impact can be avoided then it must be avoided if it is not necessary to the project.

Vegetation Removal in the Shoreland Zone:
Contact Clearwater County Environmental Services
Limited vegetative clearing is allowed to provide a view corridor and access to the shoreline as long as the work complies with the vegetative alteration requirements of the ordinance. Removal of emergent aquatic vegetation requires a permit from the DNR Fisheries office. If the vegetation is submerged, refer to the Aquatic Plant Management section for requirements.

Placement of Wells:
Contact Clearwater County Environmental Services
The Minnesota Department of Health regulates the installation of wells and the licensed well drilling company that you hire will obtain the required permit. However, it is important to ensure that the placement of the well meets all the setback requirements of the County regulations.

Septic Systems:
Contact Clearwater County Environmental Services
To obtain a building permit in the shoreland zone of Clearwater County a septic system on the property must be in compliance with the County ordinance at the time of the permit application. Check with Environmental Services before installing a septic system to assure a licensed professional is contracted to design and install the system to the necessary requirements.

New Construction and Lot Development:
Contact Clearwater County Environmental Services
Before purchasing or building on a new shoreland property, check with Environmental Services to make sure the lot is suitable for building in compliance with County regulations. Allowable setbacks from the lake, impervious surface coverage, and lot width will vary depending on the classification of the lake or stream. Additional setbacks and vegetation protection may apply to build on a bluff in the shoreland zone. Check with Environmental Services for specific requirements for your lot.

Commercial Businesses in Shoreland Areas:
Contact Clearwater County Environmental Services
Home-based or commercial businesses conducted within the shoreland zone will require a permit. (Likely a conditional use permit.)

Before purchasing a shoreland property, ask these questions and/or check with Environmental Services:
- Are all structures and the lot conforming to Clearwater County ordinances? (Is it legal?)
- Are the septic system and well properly located?
- Is the septic system in compliance with County regulations?

It is better to ask these questions first than to find out later you will not be able to build what you had planned.
Clearwater County Shoreland Property Owner’s Checklist:

Contact Environmental Services or Clearwater SWCD Before:

- Buying, clearing, or developing shoreland property.
- Building a new structure or remodeling an existing structure.
- Installing a well and/or septic system.
- Draining, mowing, filling, or excavating a wetland.
- Building a boardwalk or raised path to the lake.
- Changing the appearance or your building setback zone (shoreland impact zone) or near-shore area by clearing, cutting, planting, grading, or filling.

If in doubt or if you need clarification about any activity in the shoreland zone, contact the Clearwater County Environmental Services office.

Contact the Minnesota Department of Natural Resources Before:

- Removing emergent vegetation (cattails, bulrushes, wild rice).
- Removing or applying chemicals to any vegetation below the OHWL.
- Installing any form of rip rap or installing a retaining wall below the OHWL.
- Creating any land disturbance below the OHWL.
